

Strateprompter — Tutorial

Creating art with AI tools now allows anyone to generate high-quality artwork using only words. However, achieving consistent results is not always as simple as it seems.

Experienced AI artists have developed advanced prompt-writing techniques. Strateprompter brings those techniques into a structured workflow app designed to work with the perchance.org AI text-to-image generator.

Open:

- <https://Strateprompter.vercel.app> to start
- <https://Strateprompter.vercel.app/StoreFront> to download pre-made libraries

In this tutorial, we will use items from **Tutorial Pack 1**.

Navigation

The Strateprompter app is divided into three columns:

- Library
- Canvas
- Preview

There are also two main buttons in the top-right corner:

- Settings
- Copy

Library

The Library column contains all downloaded and saved items.

Each library card includes:

- Name
- Tags
- Action buttons

Searching

You can search items by:

- Tags
- Titles
- Authors
- Content

Search controls are found in the Settings menu. Start with **Tags only enabled** for best results.

Example:

- Typing `Style` returns items tagged “Style”
- Typing `Style Fantasy` returns items with BOTH tags
- Double-click the search bar to clear it instantly

Clicking a tag automatically adds it to the search bar.

Tags help organize your library and improve retrieval as it grows. Tags can also be color-coded in Settings.

Library Actions

Each item includes the following controls:

- **Insert** → adds the item to the Canvas
- **Delete** → removes the item
- **Preview** → view and edit contents, tags, title, or NSFW flag
- **Star (Favorite)** → marks item as favorite and moves it to the top

You can also filter to show only favorites.

Canvas

The Canvas is the core of Strateprompter.

Here you can:

- View inserted library items

- Create new blocks
 - Rearrange block order
 - Adjust block weights
 - Add seed codes
 - Adjust guidance scale
-

Blocks and Weights

Perchance allows weighted prompt blocks. This gives fine control over image generation.

Example:

- Character description weight: 1 . 0
- Style description weight: 1 . 6

Higher weights increase influence on the final image. Lower weights reduce influence.

Weights are not exact science — they often require adjustment to achieve the desired balance.

Strateprompter allows precise adjustment down to 0.01.

Block Order

The order of blocks significantly affects output.

Blocks can be:

- Dragged to reorder
 - Locked in place to prevent movement
-

Guidance Scale

Perchance uses a guidance scale to control prompt adherence:

- Lower values → more creative freedom
- Higher values → stricter adherence

Typical range: **0–20**

Strateprompter automatically includes a guidance scale unless disabled in settings.

Seed Control

A seed is a numerical value that defines the base image structure.

You can:

- Extract a seed from a generated image

- Insert it into your canvas
 - Regenerate similar images while adjusting blocks, weights, and styles
-

Canvas Actions

From the canvas you can:

- Save blocks to the library
 - Update existing library items
 - Duplicate blocks
 - Delete blocks
-

Preview

The Preview column shows your live prompt output.

Each block is displayed in parentheses:

- Each block includes its content and weight

This section is **read-only** and reflects your canvas in real time.

When ready, click **Copy** in the top-right corner.

Paste the prompt into Perchance's Description field and generate images.

Settings

The Settings menu allows full customization of Strateprompter.

Behavior

- Set default block weight
 - Choose where new blocks appear on the canvas
 - Toggle whether inserted items are collapsed or expanded
-

Canvas

- Enable or disable persistent canvas memory
- Control deletion warnings
- Toggle automatic inclusion of seed and guidance values

Library

- Color-code tags with custom rules
 - Configure search behavior (Tags, Title, Content, Author, or combinations)
 - Toggle NSFW visibility
 - Export or import library data
-

Profile

Set your name. Library items will attribute you as the author.

About

Displays app information and library size.

Let's make a scene!

Start by downloading **Tutorial Pack 1** from the StoreFront. Open **Strateprompter** in one browser tab and **Perchance AI Text-to-Image Generator** in another.

Open the **Settings** menu in Strateprompter and navigate to **Library → Library Management → Add to Library**. Select the downloaded Tutorial Pack file and open it. Strateprompter will automatically import the new content into your library.

Set Your Author Name

Since this is your first time using Strateprompter, open the **Profile** tab in Settings and enter your name into the **Author Name** field.

This allows you to:

- Track content you've created
- Search by author
- Share library items with proper attribution

Close the Settings menu when finished.

You should now see:

- 8 library items
- A blank block in the Canvas
- A Preview that displays:

(guidanceScale:::8)

You are now ready to build your first prompt.

Part 1: Creating a Character

Delete the empty Canvas block. We'll start entirely with library items.

Search your library for the tag:

Character

You should see:

- Ben
- BJ
- Pickle Boy

Click **Insert** on **Ben**.

The Preview now contains Ben's character description.

Without making any changes, click **Copy** and paste the prompt into Perchance's **Description** field.

Before generating:

- Set Art Style to **No Style**
- Choose your preferred image shape
- Set image count to **4**

Click **Generate**.

Perchance will create four images of Ben with different poses, expressions, hairstyles, and compositions.

Part 2: Finding a Seed

Choose the image you like best.

If none of them appeal to you, generate another batch.

Remember: once Perchance generates a new set of images, the previous set disappears.

Hover over your chosen image and click the "i" icon.

You will see the prompt details.

Enable:

Include Seed

Copy the prompt.

For this tutorial I'll use:

1043433559

Return to Strateprompter and paste the seed into the Canvas seed field.

Copy your prompt again and replace the old prompt in Perchance.

Now Perchance will generate images based on the same underlying composition while still allowing variations.

This gives us a stable starting point for experimentation.

Part 3: Applying an Art Style

Search your library for:

Style

Find **Akira Toriyama** and insert it.

Your Canvas now contains:

- Ben
- Toriyama Style
- Seed

Copy the prompt and paste it into Perchance.

The generated images should still resemble Ben but now appear in a distinctive manga-inspired style.

Part 4: Understanding Weight

Weights determine how strongly a block influences the final image.

Set the Toriyama block weight to:

1.4

Generate new images.

You'll notice that Ben's original appearance begins to fade as Toriyama's style becomes dominant.

Now reduce the weight to:

1.2

Generate again.

More of Ben's original features should return.

Finally, lower the style weight to:

0.8

Generate once more.

Now Ben should look much closer to the original image while retaining some Toriyama influence.

This demonstrates one of Strateprompter's greatest strengths: fine control over style influence.

Part 5: Adding a Background

Delete the Toriyama style block.

Search for:

Background

Insert:

Aliens Watching

Generate again.

Ben is no longer alone.

Our scene now tells a story.

Part 6: Adding Dramatic Lighting

Search for:

Lighting

Insert:

Volumetric God Rays

Generate another set.

Notice how dramatically the mood changes.

Lighting often has a larger impact on image quality than many users realize.

For my final version I used:

	Block	Weight
Ben		1.0
Aliens Watching		1.1
Volumetric God Rays		1.4

Seed:

1043433559

Guidance:

8

Part 7: Building a Fantasy Character

Clear the Canvas and remove the seed.

Search for:

Character

Insert:

BJ

BJ contains more unique traits than Ben, including:

- Purple hair
- Tattoos
- Piercings

These details make BJ a better test subject for style experimentation.

Browse generated images until you find one you like.

I selected:

769366383

Add the seed to Strateprompter.

Part 8: Fantasy RPG Artwork

Search Styles and insert:

Keith Parkinson

Generate images.

BJ should now resemble artwork found in classic fantasy RPG sourcebooks.

Experiment with style weights.

Notice how far you can push the style before BJ's recognizable features disappear.

This balancing act is one of the core skills of prompt engineering.

Part 9: Multiple Characters

Insert Ben again.

If you're using default settings, Ben will appear at the bottom of the Canvas.

Drag Ben so your block order becomes:

1. BJ

2. Ben
3. Keith Parkinson

Set all weights back to:

1.0

Remove the seed for now.

Generate images.

You should see fantasy scenes featuring both characters.

Occasionally Perchance may:

- Merge character traits
- Create extra characters
- Duplicate characters

This is normal behavior for generative AI.

I eventually settled on:

227349745

as my seed.

Part 10: Order Matters

Keep both character weights at:

1.0

Begin increasing the style weight.

I found that:

1.55

maintained character identity while emphasizing the style.

At:

1.8

the scene largely broke down and became generic Parkinson-style fantasy art.

Experiment with:

- Weight
- Guidance
- Block order

You may notice that moving Ben higher in the Canvas often moves him toward the foreground of the image.

Part 11: Changing Styles Completely

Delete Keith Parkinson.

Insert:

Jim Lee

Move the style block to the top.

Set style weight to:

1.6

Generate images.

The result should be dramatically different.

Where Parkinson emphasizes classic fantasy illustration, Jim Lee pushes the image toward modern superhero comics with stronger anatomy and bolder visual impact.

Part 12: Creating Your Own Block

Let's create custom content.

My Canvas currently contains:

- Ben (1.1)
- BJ (1.1)
- Jim Lee Style (1.0)

Guidance:

8

Seed:

472895681

Click **Add Block**.

Name it:

Super Hero Details

Add the following text:

Ben has a robotic arm.

BJ is wearing a tight purple leotard.

Generate images.

The changes may be subtle.

Increase the block weight to:

1.5

Generate again.

Ben should now display a cybernetic arm and BJ should take on a more superhero-inspired appearance.

Part 13: Meet Pickle Boy

Clear the Canvas and remove the seed.

Search:

Character

Insert:

Pickle Boy

Generate images.

You have now been introduced to the friendliest vinegar-soaked cucumber in existence.

Use everything you've learned:

- Add art styles
- Add lighting
- Create new blocks
- Adjust weights
- Experiment with guidance
- Add additional characters

Create the ultimate Pickle Boy masterpiece.

What's Next?

You've learned the core workflow of Strateprompter:

- Building prompts from reusable blocks
- Using seeds for consistency
- Adjusting weights
- Controlling guidance
- Rearranging block order
- Creating custom content

Download additional packs from the StoreFront to expand your library with new:

- Characters
- Styles
- Lighting effects
- Backgrounds
- Creative tools

As you create your own blocks, remember:

- More detail usually creates more consistent results.
- Too much detail can reduce Perchance's creativity.
- Positive descriptions generally work better than negative ones.

For example:

✓ **Bald head**

is usually better than

✗ **No hair**

because Perchance may focus on the word *hair* and accidentally generate a full hairstyle.

Now start experimenting and discover what combinations work best for your own creative projects.
